TOWN OF STRATHAM, NEW HAMPSHIRE

Vulnerability Assessment

of projected impacts from sea-level rise and coastal storm surge flooding

Prepared by the
Rockingham Planning Commission

March 31, 2017

This project was funded, in part, by NOAA's Office for Coastal Management under the Coastal Zone Management Act in conjunction with the New Hampshire Department of Environmental Services Coastal Program

ACKNOWLEDGEMENTS

The Rockingham Planning Commission gratefully acknowledges the participation of Town of Stratham:

Notes on Use and Applicability of this Report and Results:

The purpose of this vulnerability assessment report is to provide a broad overview of the potential risk and vulnerability of state, municipal and public assets as a result of projected changes in sea-levels and coastal storm surge. This report should be used for preliminary and general planning purposes only, not for parcel level or site specific analyses. The vulnerability assessment performed was limited by several factors including the vertical accuracy of elevation data (derived from LiDAR) and the static analysis applied to map coastal areas subject to future flooding which does not consider wave action and other coastal dynamics. Also, the estimated flood impacts to buildings and infrastructure are based upon the elevations of the land surrounding them, not the elevation of any structure itself.

PLANNING TO REDUCE RISK AND VULNERABILITY

New Hampshire's economy and quality of life have historically been linked to its shores, its vast expanses of productive saltmarshes and sandy beaches. Increased flooding has the potential to place coastal populations at risk, threaten infrastructure, intensify coastal hazards and ultimately impact homes, businesses, public infrastructure, recreation areas, and natural resources. Accounting for changes in sea level and coastal storms will help lead to informed decisions for public and private investments by minimizing risk and vulnerability.

New Hampshire seacoast municipalities are confronted by land use and hazard management concerns that include extreme weather events, storm surges, flooding and erosion. These issues are only intensified by recent increases in the frequency and intensity of extreme storm events and increases in sea level.

What is a Vulnerability Assessment?

A vulnerability assessment identifies and measures impacts of flooding from sea level rise and storm surge on built structures, human populations and natural environments. Factors that influence vulnerability include development patterns, natural features and topography. The assessment evaluates existing and future conditions such as:

- inland extent and depth of flooding
- impacts to natural and human systems
- changes in impacts between different flood levels

How can the vulnerability assessment be used?

Information from a vulnerability assessment can help guide common sense solutions, strategies and recommendations for local governments, businesses, and citizens to enable them to adopt programs, policies, business practices and make informed decisions.

Planning for the long-term effects of sea level rise may also help communities better prepare in the short-term for periodic flooding from severe coastal storms. Results from a vulnerability assessment can be incorporated into various municipal planning, regulatory and management documents.

How will the vulnerability assessment benefit the community?

The Climate Risk in the Seacoast assessment is intended to assist coastal NH communities to take actions to prepare for increase flood risk, including:

- Enhance preparedness and raise community awareness of future flood risks.
- Identify cost-effective measures to protect and adapt to changing conditions.
- Improve resiliency of infrastructure, buildings and investments.
- Protect life, property and local economies
- Protect services that natural systems provide
- Preserve unique community character

MAPPING AND ASSESSMENT METHODS

Vulnerability Assessment: Sea Level Rise and Storm Surge Scenarios

The *Climate Risk in the Seacoast* (C-RiSe) vulnerability assessment project produced maps and statistical data about the potential impacts to New Hampshire’s seven coastal municipalities from sea-level rise and storm surge to infrastructure, critical facilities transportation systems, and natural resources. As shown in Figure 1, three sea-level scenarios were evaluated accounting for a range from the intermediate-low to the highest projected sea-levels at the year 2100.

FIGURE 1: Sea-Level and Storm Surge Scenarios

Sea Level (SLR) Scenarios	SLR Intermediate Low 2100	SLR Intermediate High 2100	SLR High 2100	SLR + storm surge 2100	SLR + storm surge 2100	SLR + storm surge 2100
Sea Level Rise	1.7 feet	4.0 feet	6.3 feet	--	--	--
Sea Level Rise + Storm Surge	--	--	--	1.7 feet + storm surge	4.0 feet + storm surge	6.3 feet + storm surge

Note: Storm surge is the area flooded by the 100-year/1% change storm event

Baseline: Flooding from the sea-level rise scenarios and sea-level rise plus storm surge scenarios evaluated in this study were mapped from Mean Higher High Water (MHHW) which is 4.4 feet in the coastal region of NH. *Mean Higher High Water is the average of the higher high water height of each tidal day observed over the National Tidal Datum Epoch. The National Tidal Datum Epoch (NTDE) refers to the specific 19-year period adopted by the National Ocean Service as the official time segment over which tide observations are taken. The present NTDE is 1983 through 2001 and is considered for revision every 20-25 years (the next revision would be in the 2020-2025 timeframe).*¹

Sea-Level Rise Scenarios

The sea-level rise projections used in this study are based on an earlier study completed in 2011 by Wake et al are similar to a more recent report issued by the NH Coastal Risks and Hazards Commission’s Science and Technical Advisory Panel in 2014. As shown in the graphics below, while slightly different than the scenarios cited in the 2014 report, the sea level rise scenarios used in the *Climate Risk in the Seacoast*

¹ NOAA website at http://tidesandcurrents.noaa.gov/datum_options.html

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

assessment yield coverage estimates of flooding that are within the mapping margin of error for the scenarios in both the 2011 and 2014 reports.²

Figures 2 and 3 below document how the scenarios used in this report relate to 2011 by Wake et al but are similar to a more recent report issued by the NH Coastal Risks and Hazards Commission’s Science and Technical Advisory Panel in 2014

Assets and Resources Evaluated

Storm Surge: *Storm surge is the rise of water level accompanying intense coastal storm events such a tropical storm, hurricane or Nor'easter, whose height is the difference between the observed level of the sea surface and the level that would have occurred in the absence of the storm event.*³ Storm surge is mapped using the 100-year/1% chance flood events from the Preliminary Flood Insurance Rate Maps (FIRMs) released by FEMA in 2014. The preliminary FIRM's account for the limit of moderate wave action in coastal areas, however this assessment does account for additional flooding and impacts related to more severe wave action, wind action, erosion and other dynamic coastal processes.

Figure 4 contains a detailed list of the assets and resources evaluated as part of the Climate Risk in the Seacoast vulnerability assessment. The assets and resources evaluated are listed in subsequent tables in this report only if they are affected by one or more of the sea-level rise and/or coastal storm surge scenarios.

FIGURE 4: Assets and Resources Evaluated for the Vulnerability Assessment

Data, Methods and Results of Hydrologic and Hydraulic Modeling for Road Crossings – Climate Ready Culverts

The hydrologic and hydraulic modeling of crossings was complete by the University of New Hampshire Stormwater Center. The C-Rise project assessed both aquatic organism passage capacity and hydraulic flow capacity of ten (10) road crossings in each of the ten Great Bay coastal municipalities. The assessment was based on runoff associated with the current 10-, 25-, 50- and 100-year storm events. For each storm, each crossing was assigned a hydraulic rating and an *aquatic organism passage (AOP)* rating; both ratings are described in greater detail below.

Grid Key:		10-YR: Rating for the water's surface elevation at the inlet for the 10-yr flood flow
10 -YR Rating	25-YR Rating	25-YR: Rating for the water's surface elevation at the inlet for the 25-yr flood flow
50-YR Rating	100-YR Rating	50-YR: Rating for the water's surface elevation at the inlet for the 50-yr flood flow
		100-YR: Rating for the water's surface elevation at the inlet for the 100-yr flood flow

The AOP rating is labeled by color; Red, Orange, Gray, and Green. Ratings of Red and Orange mean that there is estimated to be little to no AOP at that crossing, with Red being no AOP for all species and Orange meaning no AOP for all species except for adult Salmonids.

Aquatic Organism Passage (AOP) Key	
	No AOP
	No AOP - Adult Salmonids
	Reduced AOP
	Full AOP

A rating of Gray means that there is reduced AOP at the crossing for all species. A rating of Green means that AOP is expected to be possible for all species.

The AOP ratings were developed using the New Hampshire protocol for assessment, which was borrowed directly from the Vermont Culvert Aquatic Organism Passage Screening Tool. This tool uses physical data collected at each crossing and may be used to rate each culvert at a crossing for AOP. At a crossing with multiple culverts, if one culvert is more passable than another, then that culvert is considered to be the path that organisms would utilize. Thus, the best rating for a culvert at a crossing is used as the rating for the crossing as a whole.

The hydraulic rating is color-coded similar to the AOP rating. The peak flows of the 10-, 25-, 50-, and 100-year storm events were used to assess the ability of the culvert to pass the flow (measured by the depth of water upstream of the culvert – known as the headwater depth)

Hydraulic Ranking Key:	
	Pass: Headwater stage is below the lowest top of top of culvert at the site
	Transitional: Headwater stage is between the lowest top of culvert and the top of the road
	Fail: Headwater stage overtops the road

was determined and compared to culvert and road elevations. The ratings for hydraulics are: Pass (green), Transitional (yellow), and Fail (red). These ratings describe the depth of the water at the inlet (the Headwater) for the flows for each of the selected storm events compared to culvert and road elevations. A rating of Pass means that the headwater depth is below the lowest top-of-pipe elevation of any culvert at

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

the crossing; a rating of Fail means that the headwater depth is above the road surface; and a rating of Transitional means that the headwater depth is somewhere between these two elevations.

The hydraulic ratings describe the headwater depth (upstream of the culvert) for each storm event flood (see Figure 5). The headwater depths are calculated using field-collected culvert and crossing data. The flood flows were calculated by one of two methods: runoff from rainfall or regression equation. For all watershed areas smaller than one square mile, the Curve Number⁴ method was used; and for watersheds larger than one square mile, flows were calculated using the Regression Equations⁵ published by the USGS for New Hampshire. Once the flows at each crossing were calculated, they were input into the Federal Highway Administration’s free culvert analysis software, HY-8, along with the necessary culvert and crossing data collected at each location. The program then calculated the headwater depth for each of the flows at each of the sites. This headwater depth is what is shown in the results, and are compared to the pipe crown and roadway elevations to determine the Hydraulic Ratings.

FIGURE 5: Example of how the hydraulic rating is applied to a culvert evaluation.

Map Design and Organization

The Climate Risk in the Seacoast map set is comprised of two components: a map depicting the extent of projected flooding from the three sea-level rise scenarios in shades of green, and a map depicting the three sea-level rise plus storm surge scenarios in shades of pink. Each of the asset categorized evaluated are displayed on these two maps. Examples of the two scenario maps are shown in Figures _____.

⁴ A curve number is a number from zero to 100 that describes how much rainfall runs off versus how much is lost to infiltration. A high curve number implies most of the rainfall runs off.

⁵ A regression equation describes a mathematical relationship between two variables in which one variable is used to predict the other.

Glossary

100-year Coastal Floodplain

Includes flood hazard areas subject to tidal flooding and storm surge and identified on the FIRMs as a Special Flood Hazard Area (SFHA). SFHA are defined as the area that will be inundated by the flood event having a 1-percent chance of being equaled or exceeded in any given year. The 1-percent annual chance flood is also referred to as the base flood or 100-year flood. In coastal areas, these SFHAs are defined as specific zones on the FIRM's: In most communities, there are two areas or flood zones within the SFHA:

- A zone – an area subject to a 1 percent annual chance of a flood event but does not have a mapped elevation and;
- AE zone – an area that has the same 1 percent annual chance of a flood event and a corresponding mapped flood elevation of 9 feet.

Accommodate

Measures that manage risk by requiring development to be built and retrofitted to be more resilient to impacts and by limiting certain types or all development in highest risk areas, favoring adaptive uses (i.e. passive uses such as recreation) and gradual modification of structures and uses as conditions change over time.

Adaptation

Adaptation refers to adjustments in ecological, social, or economic systems in response to actual or expected climatic change and their effects or impacts. It refers to changes in processes, practices, and structures to moderate potential damages or to benefit from opportunities associated with climate change.

[<http://unfccc.int/focus/adaptation/items/6999.php>]

Climate Change

Climate change refers to any significant change in the measures of climate lasting for an extended period of time. In other words, climate change includes major changes in temperature, precipitation, or wind patterns, among others, that occur over several decades or longer.

[EPA <http://epa.gov/climatechange/glossary.html>]

Coastal Flooding

Upland areas inundated by tides, storm surge, and projected sea-level rise.

Mean Higher High Water (MHHW)

The average of the higher high water height of each tidal day observed over the National Tidal Datum Epoch. The National Tidal Datum Epoch (NTDE) refers to the specific 19-year period adopted by the National Ocean Service as the official time segment over which tide observations are taken. The present NTDE is 1983 through 2001 and is considered for revision every 20-25 years (the next revision would be in the 2020-2025 timeframe).

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

Resilience

A capability to anticipate, prepare for, respond to, and recover from significant multi-hazard threats with minimum damage to social well-being, the economy, and the environment.

[EPA <http://epa.gov/climatechange/glossary.html>]

Retreat

Often the last action before abandonment, retreat follows an incremental path of planning for the eventual relocation of structures to upland areas as properties become threatened or directly impacted by rising sea level, erosion and coastal storms. Such measures may include rolling setbacks and buffers, transfer of development rights, and property acquisition/buyout programs.

Riverine (and Freshwater) Flooding

Areas inundated adjacent to freshwater drainage systems not affected by coastal flooding, including the 100-year flood plain and other areas subject to flooding from precipitation and snow melt.

Sea-level rise

Sea level is measured in various ways. *Relative Sea Level* refers the measurement of sea level at a local tide gauge station which is referenced relative to a specific point on land. These measurements at any given local tide gauge station include both measurements of global sea-level rise and local vertical land movement, such as subsidence, glacial rebound, or large-scale tectonic motion. Because the heights of both the land and the water are changing, the land-water interface can vary spatially and temporally and must be defined over time. The term *Mean Sea Level* (MSL) refers to a tidal datum (which a frame of vertical reference) defined by the average tide over a specific period of time. *Global Sea-level rise* (or eustatic sea-level rise) refers to the increase currently observed in the average *Global Sea Level Trend*, which is primarily attributed to changes in ocean volume due to two factors: ice melt and thermal expansion.

[NOAA <http://www.tidesandcurrents.noaa.gov/est/faq>]

Storm Surge

Storm surge is the rise of water level accompanying intense events such a tropical storm, hurricane or Nor'easter, whose height is the difference between the observed level of the sea surface and the level that would have occurred in the absence of the storm event.

[EPA <http://epa.gov/climatechange/glossary.html>]

Vulnerability Assessment

An evaluation of the degree to which a system is susceptible to, or unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate variation to which a system is exposed, its sensitivity, and its adaptive capacity. [www.ipcc.ch/pub/syrgloss.pdf]

PURPOSE AND APPLICATIONS OF THE VULNERABILITY ASSESSMENT

The *Climate Risk in the Seacoast* (C-RiSe) vulnerability assessment project produced maps and statistical data about the potential impacts from sea-level rise and storm related flooding to infrastructure, critical facilities transportation systems, and natural resources. in New Hampshire’s 10 Great Bay coastal municipalities. As shown in Figure 7, the assessment evaluated flood impacts from six sea-level rise and storm surge scenarios - 1.7 feet (intermediate-low), 4.0 feet (intermediate), and 6.3 feet (highest) sea-level rise projections at the year 2100 and these sea-level rise projections with the 100-year storm surge. These scenarios capture a range of plausible projections of sea levels at 2100, from the intermediate-low to the highest scenarios.

FIGURE 7: Sea-Level and Storm Surge Scenarios at year 2100

Sea Level (SLR) Scenarios	SLR 1.7 feet Intermediate Low 2100	SLR 4.0 feet Intermediate High 2100	SLR 6.3 feet High 2100	SLR 1.7 feet + storm surge 2100	SLR 4.0 feet + storm surge 2100	SLR 6.3 feet + storm surge 2100
Sea Level Rise	1.7 feet	4.0 feet	6.3 feet	--	--	--
Sea Level Rise + Storm Surge	--	--	--	1.7 feet + storm surge	4.0 feet + storm surge	6.3 feet + storm surge

Note: Storm surge is the area flooded by the current 100-year/1% chance storm event as depicted on the FEMA Flood Insurance Rate Maps (preliminary maps, 2014).

The results of this vulnerability assessment can be incorporated into existing municipal plans including the Master Plan, Hazard Mitigation Plan, Road Improvement Plan, Infrastructure Management Plan, and Capital Improvement Plan. These results can also inform zoning amendments such as floodplain development standards and natural resource protection, and land development standards in site plan review regulations and subdivision regulations.

OVERVIEW OF STRATHAM

The Town of Stratham is located along the Squamscott River, a tidal tributary of the Great Bay. Stratham’s land area covers roughly 15.1 square miles (9,664) and 0.4 square miles of inland water area (256 acres). With an estimated population of 7,303 (2014), Stratham is the eight most populated municipality in the Rockingham Planning Commission region. The inland coastal portion of Stratham that is most susceptible to coastal flooding is located in lowlands adjacent to and within floodplain of the Squamscott River and its tributaries. Although confined in extent, these low-lying areas, containing a mix of residential and commercial development and the infrastructure that services them, are particularly vulnerable to flooding from seasonal high tides, sea-level rise and coastal storms. Other flood impacts include:

- Chapmans Landing water recreation access and parking lot.
- Stuart Farm and Scamman Farm bordering the Squamscott River.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

- Reduced hydraulic capacity of four culverts on Squamscott Road.
- Well-head protection areas for residential developments west of Route 33
- 128 parcels valued at \$40.6 million and 6 residential structures valued at \$2.5 million.

DETAILED FINDINGS OF THE VULNERABILITY ASSESSMENT

Land Area Affected

Figure 8 provides data on the total acres of land and water affected for each sea-level rise and storm surge scenario. Areas affected by flooding in all scenarios evaluated represent a very small percentage of the total area of the town.

FIGURE 8: Total Acreage Affected by Sea Level Rise Scenarios (acres)

Municipality	Sea-Level Scenarios					
	SLR 1.7 feet Intermediate Low 2100	SLR 4.0 feet Intermediate High 2100	SLR 6.3 feet High 2100	1.7 feet SLR + storm surge (acres)	4.0 feet SLR + storm surge (acres)	6.3 feet SLR + storm surge (acres)
Stratham	191.6	325.9	452.6	383.0	489.6	593.5
% total	1.9	3.3	4.6	3.9	4.9	6.0

Total area of Stratham = 9,920 acres

Assets and Resources

Stratham’s impacts from sea-level rise and storm related flooding are located exclusively on the west side of town adjacent to the Squamscott River floodplain and the river’s tidal and freshwater tributaries. The affected lands are zoned residential-agricultural, and developed with a mix of commercial uses, single-family homes and active agriculture, including portions of the Scamman Farm and Stuart Farm. Portions of the Scamman Farm impacted by flooding are permanently protected by a conservation easement held by the Southeast Land Trust. Six residential properties are affected at the highest flood scenario of 6.3 feet sea-level rise plus storm surge.

Figure 9 reports summarizes impacts to assets and resources for each sea-level rise and coastal storm surge scenario. Fortunately, most of Stratham’s roads, stormwater infrastructure and critical facilities are located outside areas affected by future sea-level rise and storm related flooding. Infrastructure and critical facilities affected by 6.3 feet sea-level rise and 6.3 feet sea-level rise plus storm surge include a handful of culverts on Squamscott Road, water lines, isolated local road segments serving residential developments, two small dams, and two water access points. Refer to Figures 11, 12 and 13 for detailed impact data for each asset and resource type.

**CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE**

In Stratham, portions of 12 wellhead protection areas serving residential and condominium developments, commercial uses and a church are located within areas subject to sea-level rise and storm related flooding. This assessment did not evaluate or quantify the degree of impact this flooding may have on the wellhead protection areas, however salt water intrusion and rising groundwater levels due to sea-level rise could be of concern in the future. In addition, a number of wellhead protection areas in Newfields extend into Stratham within the high risk flood areas, including the Newfields Village Water and Sewer District, Ship to Shore restaurant and Great Bay Camping facility. Refer to Figure 14 for a complete listing of affected wellhead protection areas.

Within rising sea levels, freshwater wetlands located in the upper reaches of Jewell Hill Brook, Mill Brook, Parkman Brook and several unnamed tributaries may be impacted by saltwater inundation. This change in hydrology may result in the conversion of these freshwater wetlands to brackish systems, altering their species composition and habitat types over time.

FIGURE 9: Summary of Asset and Resources Impact Data

Sea Level (SLR) Scenarios	SLR 1.7' Intermediate Low 2100	SLR 4.0' Intermediate High 2100	SLR 6.3' High 2100	SLR 1.7' + storm surge 2100	SLR 4.0' + storm surge 2100	SLR 6.3' + storm surge 2100

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

The complete detailed vulnerability assessment information and recommendations are provided in the following sections of this report.

DETAILED VULNERABILITY ASSESSMENT RESULTS BY ASSET TYPE

Culvert Assessment

Map: Culvert Assessment show the hydraulic and aquatic organism passage function of culverts under existing precipitation conditions for the 10-year, 25-year, 50-year and 100-year storm event. Figure 10 reports the functional hydraulic status and Aquatic Organism Passage rating for each culvert.

Of the ten culverts analyzed for hydraulic rating, five pass, 2 are transitional, and three fail under the 10-year storm event. Culverts #82, #83, #84 and #85 are impacted by sea-level rise and storm surge flooding. For Aquatic Organism Passage, one culvert has full capability, and fourteen are reduced or have no capability.

FIGURE 10: Assessment of Culvert Hydraulic and Aquatic Organism Passage (AOP) Function

Crossing #	Location	Hydraulic Rating				AOP Rating	
		10-yr	25-yr	50-yr	100-yr	Color	Rating
82	Squamscott Road	Pass	Transitional	Transitional	Transitional	GREEN	Full AOP
83	Squamscott Road	Transitional	Transitional	Fail	Fail	GRAY	Reduced AOP
84	Squamscott Road	Fail	Fail	Fail	Fail	GRAY	Reduced AOP
85	Squamscott Road	Pass	Transitional	Transitional	Fail	GRAY	Reduced AOP
86	Route 33 @ Chisholm Road	Transitional	Transitional	Transitional	Fail	GRAY	Reduced AOP
87	Route 33 @Chase Lane	Pass	Transitional	Transitional	Fail	RED	No AOP

90	Route 108 @ West Road	Pass	Pass	Pass	Pass	RED	No AOP
91	Stratham Heights Road	Fail	Fail	Fail	Fail	GRAY	Reduced AOP

A rating of **Pass** means that the headwater depth is below the lowest top-of-pipe elevation of any culvert at the crossing; a rating of **Fail** means that the headwater depth is above the road surface; and a rating of **Transitional** means that the headwater depth is somewhere between these two elevations.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

*AOP = Aquatic Organism Passage is the degree to which aquatic organisms are able to pass through a crossing. Green = Full AOP, Gray = Reduced AOP, Pink = No AOP, for all species except Adult Salmonids, Pink = No AOP, for any species including Adult Salmonids.

Municipal and Critical Facilities

Maps 3 and 4 Critical Facilities and Infrastructure show the municipal critical facilities affected by sea-level rise and coastal storm surge flooding. Figure 11 reports when specific municipal critical facilities are affected by each sea-level rise and coastal storm surge scenario.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

Culverts are supporting infrastructure for the roadway network that are also highly susceptible to flooding impacts. As sea levels rise in the future, some tidal culverts may become submerged by flooding even at low tide and freshwater culverts will be influenced by tidal flooding, creating hydrologic conditions these drainage systems were not designed for.

Natural Resources

Maps: Conservation Areas and *Maps: Wetlands, Aquifers, Wellhead Protection Areas* show natural resources affected by sea-level rise and coastal storm surge flooding. Figure 14 reports the number of acres by natural resource type affected for each sea-level rise and coastal storm surge scenario. The greatest impacts to wetland systems are in the tidal systems. Over time, low marsh may convert to mud flats and high marsh may convert to low marsh as these systems are inundated by rising seas. Significant acres of high quality habitat and natural resources identified in the NH Wildlife Action Plan and Coastal Conservation Plan, and Conserved lands may be impacted by future flooding. These natural shorelands can act as critical flood storage areas to protect infrastructure and private property from rising seas and storm events. No impact to designated wellhead protection areas, and although minimal impacts are reported for stratified drift aquifers, the assessment did not evaluate potential impacts to private drinking water wells from salt water intrusion as sea-level rises.

Lowlands on the Stuart Farm and Scamman farm used for hay and crop production and cattle grazing are impacted under both sea-level rise and storm surge scenarios. All soils, including farmland soils in flood prone areas, are at risk of contamination by floodwaters.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

FIGURE 15: Conservation Lands and Wildlife Action Plan (acres)

Figure 15 shows the spatial extent of wellhead protection areas in Stratham which serve as public water supplies for multi-family and condominium developments. [Note the Squamscott River is the boundary between Stratham, Newfields and Exeter.]

Although most of these wellhead protection areas are not inundated by sea-level rise or storm surge, rising sea level can result in rising groundwater levels and saltwater intrusion which could influence the quality and quantity of these drinking water sources.

Figure 16 reports the acres of conservation lands (by named easement) and high value habitats from the NH Wildlife Action Plan impacted for each sea-level rise and coastal storm surge scenario. Over time, coastal flooding may impact sensitive habitats identified in the Land Conservation Plan for NH's Coastal Watersheds (2006) and the NH Wildlife Action Plan (updated in 2015). Such habitats include nesting and breeding sites for shorebirds, tidal wetlands and saltmarsh, freshwater wetlands, vernal pools, forests, and scrub-shrub and meadow landscapes. The ability of these habitats to accommodate changing environmental conditions will depend on variables such as the rate and extent of change, competition with invasive species, and soil and landscape conditions.

Figure 17 report acres of conservation lands, NH Wildlife Action Plan high value habitat and Land Conservation Plan for NH's Coastal Watershed – Focus Areas affected by each of the sea-level rise and storm surge scenarios. The riparian corridors and shorelands in these habitats and focus areas will serve to accommodate flood waters and rising seas over time which will greatly reduce impacts to public and private assets. Based on the assessment, tidal marshes along the Squamscott River may become open water as sea level rises, unless the marshes are able to keep pace by building upward. A marsh migration model would need to be done to more accurately predict the condition of tidal marshes under different sea-level rise scenarios. Over time, coastal flooding may impact sensitive habitats identified in the Land Conservation Plan for NH's Coastal Watershed (2006) and the NH Wildlife Action Plan (updated in 2015). Such habitats include

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

nesting and breeding sites for shorebirds, tidal and freshwater wetlands, vernal pools, forests, scrub-shrub and meadow landscapes.

Land Use

Maps: Extent of Sea-Level Rise and Sea-Level Rise + Storm Surge Flooding show upland affected by sea-level rise and coastal storm surge flooding above mean higher high water. Figure 18 reports the number of acres of upland affected for each sea-level rise and coastal storm surge scenario. Under the 6.3 feet sea-level rise scenario, flooding is confined to lowland areas and floodplain of the Squamscott River and its tributaries Hill Brook, Mill Brook and several unnamed tributaries. Under the 6.3 feet sea-level rise plus storm surge scenario, additional upland impacts include inundation of upper portions of the freshwater drainages systems, neighborhood roads and culverts, and increased interior flooding at the sites already impacted under the 6.3 feet sea-level rise scenario.

FIGURE 18: Uplands (acres)

Sea Level (SLR) Scenarios	SLR 1.7 feet Intermediate Low 2100	SLR 4.0 feet Intermediate High 2100	SLR 6.3 feet High 2100	SLR 1.7 feet + storm surge 2100	SLR 4.0 feet + storm surge 2100	SLR 6.3 feet + storm surge 2100
Acres	78.1	182.5	297.9	232.9	333.2	433.6
% Upland	0.8	2.0	3.2	2.5	3.6	4.7

Total Upland in Stratham = 9,207 acres. Upland refers to land above mean higher high water (highest tidal extent).

Parcels and Assessed Value

Figure 19 reports the number of parcels affected for each sea-level rise and coastal storm surge scenario and the aggregated assessed value of these parcels. The degree to which the parcel and any development on the parcel is affected by sea-level rise or storm related flooding was not analyzed. Affected parcels were identified based on their location either partially or fully within the extent of the scenarios evaluated. The data may include a number of high value parcels under state and municipal ownership.

FIGURE 19: Parcels and Assessed Value by Scenario

Sea Level Rise (SLR) Scenarios	Number of Parcels Affected by Scenario	Aggregate Value of Affected Parcels	Percent Total Assessed Value
1.7 feet SLR	85	\$25,198,948	2.05
4.0 feet SLR	102	\$31,024,048	2.5
6.3 feet SLR	112	\$35,444,548	2.9
1.7 feet SLR + storm surge	105	\$33,354,348	2.7
4.0 feet SLR + storm surge	114	\$36,318,948	2.9
6.3 feet SLR + storm surge	128	\$40,604,748	3.3

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

The total assessed land and property value for Stratham = \$1,230,389,707 (2016 town report)

Assets in Stratham are only impacted by the two highest flood scenarios - 4.0 feet sea-level rise plus storms surge, and 6.3 feet sea-level rise plus storm surge. Impacts to assessed value from flooding are minimal, however there is a 500 percent increase in the number of affected parcels and approximately a \$2.1 million increase in assessed value from the 4.0 feet to the 6.3 feet sea-level rise plus storm surge scenario. Figure 20 reports the number of homes affected by each of the sea-level rise and storm surge scenarios and the aggregated percent assessed value of these homes.

FIGURE 20: Residential Structures and Assessed Value by Scenario

Sea Level Rise (SLR) Scenarios	Number of Homes Affected by Scenario	Aggregate Value of Affected Parcels	Percent Total Assessed Value
1.7 feet SLR	0	\$0	0
4.0 feet SLR	0	\$0	0
6.3 feet SLR	0	\$0	0
1.7 feet SLR + storm surge	0	\$0	0
4.0 feet SLR + storm surge	0	\$0	0
6.3 feet SLR + storm surge	6	\$2,473,822	0.20
The total assessed property value for Stratham = \$1,230,389,707 (2016 town report)			

FEMA Flood Hazard Areas

Maps: Preliminary FEMA Flood Hazard Areas show areas within the 100-year floodplain affected by sea-level rise and coastal storm surge flooding. Figure 21 reports the acreage within the current 100-year floodplains affected for each sea-level rise and coastal storm surge scenario.

From a floodplain management perspective, creating more resilient development within the current 100-year floodplain will provide protection against flood impacts from long term sea level rise.

FIGURE 21: FEMA Flood Hazard Areas (acres)

Sea Level (SLR) Scenarios	SLR 1.7 feet Intermediate Low 2100	SLR 4.0 feet Intermediate High 2100	SLR 6.3 feet High 2100	SLR 1.7 feet + storm surge 2100	SLR 4.0 feet + storm surge 2100	SLR 6.3 feet + storm surge 2100
100-year floodplain	191.6	321.9	339.7	335.8	341.0	342.4
Percentage of SLR within 100-year floodplain (FP)	100%	99% (4 acres beyond FP)	75% (113 acres beyond FP)	88% (47 acres beyond FP)	70% (148 acres beyond FP)	58% (251 acres beyond FP)

Floodplain assessment based on Preliminary Flood Insurance Rate Maps (FIRMs) released by FEMA in 2014.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

In Stratham, the 100-year floodplain is highly vulnerable to sea-level rise and storm surge related flooding., Under the other six scenarios, flooding generally falls within the current 100-year floodplain, extending beyond into the 500-year floodplain in certain areas. From a floodplain management perspective, creating more resilient development within the current 100-year floodplain will provide protection against flood impacts from long term sea level rise. Under the 6.3 feet sea-level rise plus storm surge scenario, flooding extends well beyond the 100-year floodplain.

ISSUES AND CONSIDERATIONS

The following issues and considerations of local and regional importance were identified during project meetings with municipal staff and land use board and commission members.

- Improvements to the state roadway network (elevating, enlarging culvert and bridges) may affect local connector roads, driveway access points and connecting infrastructure and utilities.
- Although roadways, buildings and infrastructure can be protected by raising them above projected sea-level rise elevations, supporting land and land based uses may be impacted by daily tidal flooding from projected sea-level rise.
- Planning for long term sea-level rise can be integrated with existing regulatory and management frameworks for the current 100-year floodplain.
- Ownership of transportation infrastructure and assets by multiple state agencies (roadways, culverts, state parks, parking areas) and town responsibility for management of assets (sidewalks, roads in urban compact areas) creates complexity in comprehensively managing these systems and implementing climate adaptation strategies.
- Flooding from sea-level rise and coastal storm surge impacting the state and local roadway network adjacent to the Route 101 interchange may disrupt the designated evacuation network in Stratham and connections to evacuation routes in adjacent towns.
- Providing information about potential flood hazards to businesses and residents, and early notification of flood risk during a coastal storm event would enhance public safety and preparedness.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

- Long term infrastructure management would benefit from an analysis of the costs necessary to improve roads and drainage infrastructure to withstand projected sea-level rise elevations at 2050 and 2100.

RECOMMENDATIONS

The following recommendations are short-term climate adaptation actions that can be included in the town's Natural Hazards Mitigation Plans, Master Plan and other planning and policy documents. These actions are focused on strengthening land use development standards, resource protection, municipal policy and plans, and public support to create more resilient development, infrastructure and natural systems. *Refer to Appendix B for an expanded list of climate adaptation strategies.*

REGULATORY

R1 - Elevate Structures 2 feet Above Base Flood Elevation. Adopt standards in floodplain zoning and/or Site Plan Review and Subdivision Regulations that require all new development and redevelopment to be elevated 2 feet above the base flood elevation. Two feet of additional elevation will ensure that structures are protected from flooding based on the highest sea-level rise projection of 2 feet by 2050.

R2 - Coastal Buffers and Tidal Marshes. Adopt buffers and setbacks that adequately separate development and infrastructure from tidal wetlands, freshwater wetlands and surface waters to sustain flood storage capacity, and allow for inland migration of tidal marsh systems and conversion of freshwater systems to tidal systems to accommodate projected changes in sea-levels.

PLANNING AND POLICY

P1 - Natural Hazards Mitigation Plan. Incorporate the vulnerability assessment information and recommendations from the Climate Risk in the Seacoast Vulnerability Assessment report and maps in the town's 2015/2016 Natural Hazards Mitigation Plan update. Continue revising and updating the assessment information and climate adaptation recommendations in future updates of the Plan.

P2 - Master Plan Coastal Hazards Chapter. Adopt a Coastal Hazards Chapter in the town's Master Plan that incorporates information and recommendations from the Climate Risk in the Seacoast Vulnerability Assessment report and maps.

P4 - Capital Infrastructure and Investments. Incorporate consideration of impacts from sea-level rise and coastal storm surge flooding in current and future capital infrastructure projects. Incorporate the Climate Risk in the Seacoast vulnerability assessment information into infrastructure management plans and capital

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR TOWN OF STRATHAM, NEW HAMPSHIRE

improvement plans. Evaluate the extent of sea-level rise and storm surge flooding on individual facilities (e.g. wastewater treatment plant, transfer station, high school).

P5 - Land Conservation. Land conservation offers the greatest opportunities to provide for adaptation to the effects of sea-level rise and coastal storm flooding and climate change impacts.

- Adopt a targeted scoring framework or incorporate new scoring criteria into existing land conservation prioritization efforts that consider climate adaptation benefits when evaluating land for conservation purposes.
- Increase funding and resources for land conservation, land management programs, and land stewardship activities. (Note: Land conservation scores very high as an activity in the FEMA Community Rating System program.)
- Support retreat from high risk areas by buying properties and restoring them to a natural condition.

P6 - Wetlands Mitigation Site Inventory. Identify and inventory lands where protection of tidal and freshwater wetlands would provide tangible benefits to protect against flooding, and restoration opportunities to remove barriers to tidal function and marsh and migration. This inventory will allow the town to pre-identify and prioritize sites that can be permanently preserved as a mitigation strategy for wetland impacts from development in high risk coastal areas.

P7 - Evacuation Planning. Prepare evacuation plans and coordinate these plans with towns in the coastal region to implement timely and comprehensive planning and notification for coastal storm events. Mark evacuation routes with signage and communicate these routes to the public with information on the town's website and printed maps.

COMMUNITY OUTREACH AND ENGAGEMENT

O1 – NH Coastal Adaptation Workgroup. The NH Coastal Adaptation Workgroup (CAW) is a voluntary collaborative advocacy group consisting of members from federal and state agencies, regional and non-profit organizations, municipalities, academia, and private businesses. The group's focus is to: 1) pursue activities that improve the resilience of natural systems, infrastructure and development to the impacts of climate change; and 2) facilitate communication and cooperation among stakeholders throughout the coastal watershed, especially with regard to research, programs and other efforts designed to help preserve, protect, and strengthen the Great Bay and Hampton-Seabrook Estuary. CAW can assist the city with outreach, planning and regulatory activities involving climate adaptation implementation.

- Support work of the NH Coastal Adaptation Workgroup in climate adaptation activities that facilitate, coordinate, provide technical information, and convene public outreach events.

O2 - Implement FEMA's High Water Mark Initiative. Consider implementing the FEMA High Water Mark Initiative (HWMI) as a public outreach activity. The HWMI provides information on past floods, such as

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

documenting high water marks in public places, and posting maps and photographs of past floods on their websites. High water marks can be displayed on public buildings or on permanently installed markers.

O3 - Coastal Flood Hazard Overlay District. Use the Coastal Flood Hazard Overlay District concept as a tool to inform property owners of existing and future risks and hazards based on projected sea-level rise and coastal storm surge flooding.

O4 - Living Shorelines and Landscaping. Maintaining natural shorelines is an effective way to preserve the functions of shoreline systems (marshes, dunes, estuaries) in providing valuable services including flood storage, recreational areas, and commercial harvesting of fish and shellfish.

- Provide information to property owners about living shorelines and the importance of retaining the functions of natural shorelines, and implementing landscaping best practices.
- Implement living shorelines projects on town lands to demonstrate best practices, and the benefits and effectiveness of living shorelines approaches.

Refer to Stratham's Natural Hazards Mitigation Plan for additional recommendations for outreach and engagement activities.

Recommendations from the Coastal Risk and Hazards Commission Final Report (2016)

CC7. Incorporate coastal hazards, risks and vulnerability in policies, plans and investments.

ACTIONS:

- a. Evaluate deficiencies and barriers in municipal regulations, plans and policies, and their implications for regional vulnerability.
- b. Incorporate coastal hazards and risks assessments, including social vulnerability information, in municipal hazard mitigation plans, natural hazards and climate change adaptation Master Plan chapters, and emergency management plans.
- c. Encourage municipalities to develop detailed preparation, response and recovery plans that build on existing plans and initiatives.
- d. Encourage municipalities to adopt buffers and setbacks that better account for risk and vulnerability of structures, facilities, and natural resources and maintain ecosystem services (e.g. flood storage, storm surge attenuation, reduced impacts to public structures and facilities, and private property).
- e. Incorporate vulnerability assessment information and adaptation strategies for structures and facilities planning and investment for long term capital projects in municipal Capital Improvement Programs (CIPs).
- f. Improve connections between municipal hazard mitigation plans, master plans and capital improvement plans.
- g. Identify and reduce existing inconsistencies between municipal plans and state plans, such as hazard mitigation plans, building codes, design standards, and evacuation plans.
- h. Consider the concepts of uncertainty and risk in decision-making and action planning.
- i. Encourage communities that conduct floodplain management activities that exceed the minimum requirements of the National Flood Insurance Program (NFIP) to consider joining and participating in the Community Rating System (CRS), which provides discounts to annual flood insurance premiums for some residents and businesses as a reward for their communities' activities.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

E2. Incorporate best available climate science and vulnerability assessment information in state, regional, and municipal economic development plans.

ACTIONS:

- a. Encourage private property owners and businesses to incorporate best available climate science and vulnerability assessments in their decision making and preparedness plans.
- b. Consider vulnerabilities of local tax base, state economic development plan, retention or replacement of economic resources, at risk populations and population migration.
- c. Improve management, coordination and delivery mechanisms to ensure continuity of services to essential facilities, people, businesses and employment centers.
- e. Identify economic assets that are vulnerable to storm surge, sea-level rise, and extreme precipitation; understand the scope of that vulnerability; and evaluate existing statutes, ordinances, rules and regulations, policies, programs, and plans to determine whether changes should be made to reduce

E3. Use appropriate and available mechanisms, including but not limited to incentives and market-based tools to fund climate adaptation strategies.

ACTIONS:

- a. Align land acquisition and easement programs to transfer vulnerable properties into conservation.
- b. Establish stormwater utilities to fund retrofits to existing development and future improvements.
- c. Develop and utilize tools to identify cost effective strategies and public investments for adapting to increased flood risk in vulnerable areas.
- d. Develop special overlay districts, tax credits and revolving loan funds as mechanisms to discourage development in vulnerable areas.
- e. Implement voluntary transfer of development rights programs and other economic incentives to acquire or conserve property in high risk areas.
- f. Create statewide and municipal funding programs for climate adaptation strategies.
- g. Adapt economic development planning approaches to respond to changing environmental conditions and leverage shifting opportunities.
- h. Promote resilience and sustainability planning as economic development strategies.

E4. Improve information available to property owners and prospective buyers about coastal hazards and vulnerabilities.

ACTIONS:

- a. Improve consumer protection disclosure of properties vulnerable to coastal flooding.
- b. Distribute flood protection safety information to property owners in high-risk areas.
- c. Encourage homeowners in moderate- to low-risk areas to purchase Preferred Risk Policy.

BL2. Implement regulatory standards and/or enact enabling legislation to ensure that the best available climate science and flood risk information are used for the siting and design of new, reconstructed, and rehabilitated state-funded structures and facilities, municipal structures and facilities, and private structures.

ACTIONS:

- c. Encourage municipalities to use one of the following three approaches^{xiii,xiv,xv} for determining a higher vertical flood elevation and expanded corresponding horizontal floodplain than the current base flood elevation and floodplain to address current and future flood risk for new construction, substantial improvement, or repairs to substantially-damaged municipal and private structures and facilities:
 - i. *Climate-informed Science Approach* – use the best available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science.^{xvi}

**CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE**

- ii. *Freeboard Value Approach* – use the freeboard value, reached by adding an additional two (2) feet to the base flood elevation for non-critical structures and facilities and from adding an additional three (3) feet to the base flood elevation for critical^{xvii} structures and facilities.
- iii. *The 0.2-percent-annual-chance Flood Approach* – use the 0.2-percent-annual-chance flood elevation (also known as the 500-year flood elevation).

- xi An acceptable source of climate science for New Hampshire includes the Coastal Risk and Hazards Commission Science and Technical Advisory Panel report, Sea-level Rise, Storm Surges, and Extreme Precipitation in Coastal New Hampshire: Analysis of Past and Projected Trends, as amended.
- xii Any activity for which even a slight chance of flooding would be too great. For expanded description of “critical action” see Part I, Section 6 of Guidelines for Implementing Executive Order 13690.
- xiii See Federal Executive Order 13690, Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Input.
- xiv See Guidelines for Implementing Executive Order 13690.
- xv See [Appendix F](#) for State of New Hampshire comments on Draft Guidelines for Implementing Executive Order 13690.
- xvi An acceptable source of climate science for New Hampshire includes the Coastal Risk and Hazards Commission Science and Technical Advisory Panel report, Sea-level Rise, Storm Surges, and Extreme Precipitation in Coastal New Hampshire: Analysis of Past and Projected Trends, as amended.
- xvii Any activity for which even a slight chance of flooding would be too great. For expanded description of “critical action” see Part I, Section 6 of Guidelines for Implementing Executive Order 13690.

BL4. Integrate comprehensive land use and environmental planning with floodplain management approaches that prevent and minimize impacts from coastal hazards.

ACTIONS:

- c. Promote land development regulations that reduce vulnerability and protect ecosystem services (e.g. open space/cluster development).
- d. Prepare watershed-based plans that address comprehensive water resource management principles focused on changes in hydrologic systems resulting from climate change.
- e. Consider prohibiting development in areas destroyed by storms, experiencing repetitive loss of structures, and subject to chronic flooding and erosion. Consider adaptive reuse and/or acquisition of at-risk private properties.

NR2. Develop natural resource restoration plans that explicitly consider future coastal risk and hazards, and the ecological services that they provide.

ACTIONS:

- b. Provide recommendations and incentives for removal or modification of structures and facilities, such as freshwater and tidal crossings, that create barriers to tidal flow and habitat migration, particularly those that will be impaired or severely impacted by sea-level rise, storm surge, or extreme precipitation.
- c. Engage in best practices for invasive species planning and removal and incorporate climate considerations in invasive species removal plans.
- d. Utilize existing funding sources for natural resource restoration (e.g. offset measures, state Aquatic Resource Mitigation fund).

NR4. Consider ecosystem services provided by natural resources in land use planning, master plans, and asset decisions.

ACTIONS:

- b. Implement strategies and tools (such as land regulations, incentives, building regulations) designed to maintain or restore pervious surfaces, provide nutrient barriers, protect vegetated buffers and maintain wildlife passage.
- e. Develop best management practices for shoreline buffers, including information on appropriate use of shoreline hardening, bank stabilization, vegetation restoration and agricultural practices.
- f. Explore options to minimize shoreline hardening and promote natural or hybrid shoreline protection strategies.
- h. Develop guidelines and provide incentives for communities to incorporate climate adaptation actions for wildlife protection in master plans, hazard mitigation plans, and zoning ordinances.

CLIMATE RISK IN THE SEACOAST: VULNERABILITY ASSESSMENT REPORT FOR
TOWN OF STRATHAM, NEW HAMPSHIRE

H2. Develop plans and implement strategies to prepare and adapt recreational resources based on best available climate science.

ACTIONS:

- a. Conduct public information hearings to understand the impacts of proposed climate adaptation strategies.
- b. Assess existing and future recreational areas for their potential to provide storage for flood waters and stormwater runoff.
- c. Preserve open space and recreational areas that serve to minimize climate change impacts.
- d. Integrate recreational and open space planning into climate adaptation planning and the Tidal Shoreline Management Plan.
- e. Integrate protection of recreational resources into land use and management, engineering, regulatory components of state and municipal plans including the Tidal Shoreline Management Plan, hazard mitigation plans, Master Plans, and design standards.

H3. Identify and survey cultural and historic resources and assess their vulnerability to coastal risk and hazards based on best available climate science.

ACTIONS:

- a. Map all currently surveyed cultural and historical resources.
- b. Identify asset types that may also be cultural and historic resources.
- c. Use reconnaissance level survey and vulnerability assessments to identify high priority areas for intensive survey.

H4. Develop long-term plans for protecting, adapting, or reducing risk to cultural resources affected by climate change.

ACTIONS:

- a. Create or modify adaptation strategies for cultural and historic buildings affected by climate change, including plans for protecting or relocating resources.
- b. Integrate protection of cultural and historical resources into land use and management, engineering, regulatory components of state and municipal plans including the Tidal Shoreline Management Plan, hazard mitigation plans, Master Plans, and design guidelines.
- e. Create programmatic strategies to compensate for the loss of historic asset types that will be replaced in order to adapt to climate change impacts.

APPENDIX – MAP SET

The following recommendations are short-term climate adaptation actions that can be included in the town's Natural Hazards Mitigation Plans, Master Plan and other planning and policy documents. These actions are focused on strengthening land use development

Map - Extent of Projected Tidal Flooding - SLR 1.7', 4.0' and 6.3'

Map - Extent of Projected Tidal Flooding - SLR + Storm Surge

Map - Infrastructure - SLR 1.7', 4.0' and 6.3'

Map - Infrastructure - SLR + Storm Surge

Map - Transportation Assets - SLR 1.7', 4.0' and 6.3'

Map - Transportation Assets - SLR + Storm Surge

Map - Water Resources 1.7', 4.0' and 6.3'

Map - Water Resources - SLR + Storm Surge

Map - Land Resources - SLR 1.7', 4.0' and 6.3'

Map - Land Resources - SLR + Storm Surge
